

Limitations of RDBMS - 2

Limitations of RDBMS continued..

3. Setting up RDBMS database is very costly

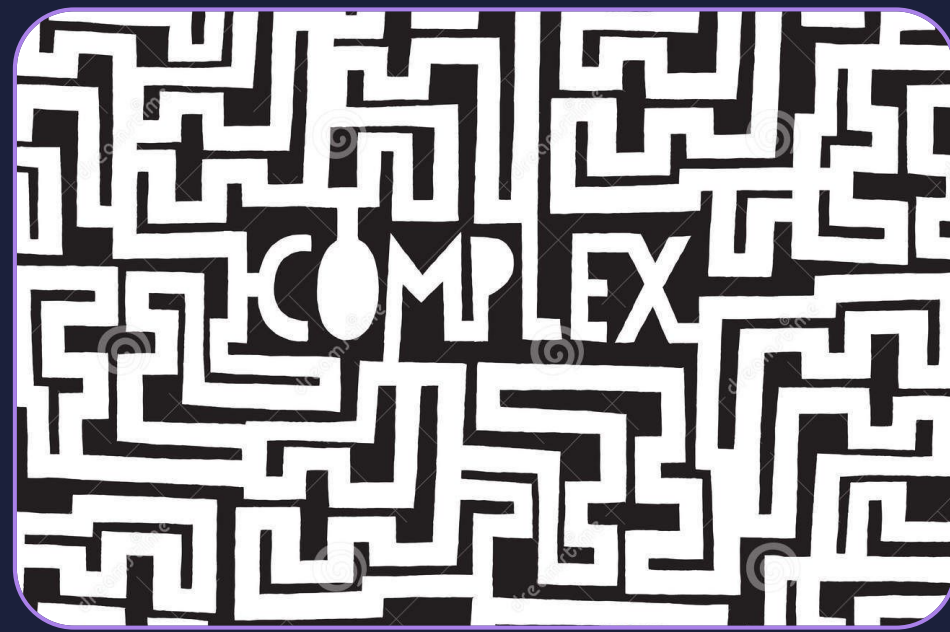

- The most commonly used RDBMS database is from Oracle which has a very expensive Enterprise Level license.

4. Schema design in RDBMS is very complex

- RDBMS requires tables to be structured and normalized appropriately.
- In most of the cases, to fetch the data, we need the application of complex join operations which again add to complexity

Conclusion

- As we adapted to the new requirements, we needed a solution that offers flexible schema, easy query capabilities, and scalability.
- This led to the discovery of NoSQL which is replacing RDBMS
